

Births: Final Data for 2019

by Joyce A. Martin, M.P.H., Brady E. Hamilton, Ph.D., Michelle J.K. Osterman, M.H.S., and Anne K. Driscoll, Ph.D., Division of Vital Statistics

Abstract

Objectives—This report presents 2019 data on U.S. births according to a wide variety of characteristics. Trends in fertility patterns and maternal and infant characteristics are described and interpreted.

Methods—Descriptive tabulations of data reported on the birth certificates of the 3.75 million births that occurred in

2019 are presented. Data are presented for maternal age, live-birth order, race and Hispanic origin, marital status, tobacco use, prenatal care, source of payment for the delivery, method of delivery, gestational age, birthweight, and plurality. Selected data by mother's state of residence and birth rates by age are also shown. Trend data for 2010 through 2019 are presented for selected items. Trend data by race and Hispanic origin are shown for 2016–2019.

Figure 1. Method of delivery: United States, 2016–2019

Results—A total of 3,747,540 births were registered in the United States in 2019, down 1% from 2018. The general fertility rate declined from 2018 to 58.3 births per 1,000 women aged 15–44 in 2019. The birth rate for females aged 15–19 fell 4% between 2018 and 2019. Birth rates declined for women aged 20–34 and increased for women aged 35–44 for 2018–2019. The total fertility rate declined to 1,706.0 births per 1,000 women in 2019. Birth rates declined for both married and unmarried women from 2018 to 2019. The percentage of women who began prenatal care in the first trimester of pregnancy rose to 77.6% in 2019; the percentage of all women who smoked during pregnancy declined to 6.0%. The cesarean delivery rate decreased to 31.7% in 2019 (Figure 1). Medicaid was the source of payment for 42.1% of all births in 2019. The preterm birth rate rose for the fifth straight year to 10.23% in 2019; the rate of low birthweight was essentially unchanged from 2018 at 8.31%. Twin and triplet and higher-order multiple birth rates both declined in 2019 compared with 2018.

Keywords: birth certificate • maternal and infant health • birth rates • maternal characteristics • National Vital Statistics System

Introduction

This report presents detailed data on numbers and characteristics of births in 2019, birth and fertility rates, maternal demographic and health characteristics, medical and health care utilization, source of payment for the delivery, and infant health characteristics. A report of provisional birth statistics for 2019 presented data on selected topics based on a sample of nearly all (99.96%) 2019 births (1); a National Center for Health Statistics (NCHS) Data Brief presented selected characteristics based on final data for 2019 births (2).

In addition to the tabulations included in this report, more detailed analysis is possible by using the annual natality public-use file. The data file may be downloaded from https://www.cdc.gov/nchs/data_access/Vitalstatsonline.htm (3). The public-use file does not include geographic detail; a file with this information may be available upon special request (4). Birth data may also be accessed via the Centers for Disease Control and Prevention's (CDC) Wide-ranging Online Data for Epidemiologic Research (WONDER). Wonder is a user-friendly Web system that makes CDC's information resources available to public health professionals and the public (5).

2003 revision of U.S. Standard Certificate of Live Birth

Starting in 2016, all 50 states, the District of Columbia (D.C.), Puerto Rico, Guam, Commonwealth of the Northern Marianas, and U.S. Virgin Islands reported data based on the 2003 U.S. Certificate of Live Birth. American Samoa continued to report based on the 1989 birth certificate revision. Internet-only tables on a number of additional topics, such as births by attendant and place and delivery, mean age of mother by live-birth order, maternal prepregnancy body mass index, infections during pregnancy, and maternal morbidity, are also available;

see [List of Detailed Tables](#). For information on data quality, see reports that assessed the quality of selected medical and health data from the 2003 revised birth certificate and the "User Guide to the 2019 Natality Public Use File" (6–8).

Methods

Data shown in this report are based on 100% of the birth certificates registered in all states and D.C. More than 99% of births occurring in the United States are registered (8). Tables showing data by state also provide separate information for Puerto Rico, Guam, and Commonwealth of the Northern Marianas. These areas, however, are not included in totals for the United States. Data for the U.S. Virgin Islands and American Samoa were not available for 2019.

The 2003 revision of the U.S. Standard Certificate of Live Birth allows the reporting of more than one race (multiple races) for each parent (9), in accordance with the revised standards issued by the Office of Management and Budget (OMB) in 1997 (10). Starting in 2016, all 50 states, D.C., Puerto Rico, Guam, Northern Marianas, and U.S. Virgin Islands reported race data in accordance with these 1997 OMB standards that allow for the reporting of a minimum of five race categories either by single race (i.e., reported alone) or in combination (i.e., more than one race or multiple races) (10). The race and Hispanic-origin groups shown in this report follow the 1997 standards and differ from the bridged-race categories shown in most previous reports that are based on data from 2015 and earlier (11). The new categories are: non-Hispanic single-race white, non-Hispanic single-race black or African American, non-Hispanic single-race American Indian or Alaska Native (AIAN), non-Hispanic single-race Asian, non-Hispanic single-race Native Hawaiian or Other Pacific Islander (NHOPI), and Hispanic (for brevity, text references to non-Hispanic white or non-Hispanic black women omit the term "single-race.") Because single-race data are not available for the entire United States prior to 2016, only race data for 2016–2018 are shown in this report. For more information on differences between single- and bridged-race groups, see "Births: Final Data for 2016" (12).

Race and Hispanic origin are reported independently on the birth certificate and reporting of Hispanic-origin ethnicity was not affected by the change to the 1997 OMB standards. Most tables in this report show data for the categories of non-Hispanic single-race white, non-Hispanic single-race black, and Hispanic. Selected tables also include data for the categories non-Hispanic single-race AIAN, non-Hispanic single-race Asian, and non-Hispanic single-race NHOPI. Data are also presented in some tables for specific Hispanic groups: Mexican, Puerto Rican, Cuban, Central and South American, and Other and unknown Hispanic. Beginning with 2018, data are presented for an additional Hispanic group, Dominican. Data for this subgroup had previously been included in the category "Other and unknown Hispanic."

Trend tables included in the detailed tables for this report include the years 2010–2019; see [List of Detailed Tables](#). Longer-term trends previously shown in this report series can be found in earlier-year reports (e.g., "Births: Final Data for 2015") (11).

In this report, the total number of births includes births to women up to age 64. In tables that include age of mother, the oldest age groups shown (40–54, 45–49, 45–54, or 50–54) include births to mothers up to age 64 (births to mothers 55–64 are recategorized to ages 50–54).

For information on levels of incomplete reporting by state, see the User Guide (8). For information on the measurement of data items shown in this report, and the Internet tables, imputation techniques used, computation of derived statistics, and definitions of terms, see the User Guide (8).

Demographic Characteristics (Tables 1–12)

Births and birth rates

Number of births

In 2019, 3,747,540 births were registered in the United States, down 1% (or 44,172) from 2018 (Table 1, Figure 2). This is the fifth year that the number of births has declined following an increase in 2014. Before that year, the number of births declined steadily from 2007 through 2013 (11).

Among the race and Hispanic-origin groups, the number of births declined 2% for non-Hispanic white and non-Hispanic AIAN women, and 1% for non-Hispanic black and non-Hispanic Asian women from 2018 to 2019. The number of births for non-Hispanic NHOPI women rose 3% in 2019, and the number of births for Hispanic women was essentially unchanged (Tables 1, 3, and 6). Among the specified Hispanic groups, births rose 12% for Central and South American women in 2019, were essentially unchanged for Mexican, Puerto Rican, Cuban, and Dominican women (Tables 4 and 7), and declined 16% for women of Other and unknown Hispanic origin. The increase in Central and South American births and the decline in births to women of Other and unknown Hispanic origin largely reflects the implementation of a new reporting system in California, which resulted in fewer unknowns and therefore more specific Hispanic-origin responses on birth records; see User Guide (8).

Fertility rate

The **general fertility rate** (GFR) for the United States in 2019 was 58.3 births per 1,000 females aged 15–44, down 1% from 2018 (59.1) and a record low rate for the nation (Table 1) (11, 13). This is the fifth year that the rate has declined following an increase in 2014. From 2007 to 2013, the GFR declined steadily (11).

Figure 2. Live births and general fertility rates: United States, 1970–2019

Among the race and Hispanic-origin groups, the GFR declined for nearly all groups in 2019, down 3% for non-Hispanic AIAN, 2% for non-Hispanic white, and 1% for non-Hispanic black, non-Hispanic Asian, and Hispanic females. The observed increase in the rate for non-Hispanic NHOPI females from 2018 to 2019 was not significant.

Age of mother

Birth rates decreased for females aged 15–34, increased for females aged 35–44, and were unchanged for females aged 10–14 years and 45–49 from 2018 to 2019.

Teenagers—The birth rate for females aged 15–19 in the United States in 2019 was 16.7 births per 1,000, down 4% from 2018 (17.4) and another record low ([Table 2](#), [Figure 3](#)) (11,13,14). Since 2009, the teen birth rate has fallen to a new low each year. The rate for this group has declined 60% since 2007 (41.5), the most recent high, and 73% since the 1991 high (61.8). The number of births to teenagers aged 15–19 was 171,674 in 2019, down 5% from 2018 (179,871) (15).

The 2019 birth rates for teenagers aged 15–17 and 18–19 were 6.7 and 31.1 births per 1,000 females, respectively, down 7% and 4% from 2018, to record lows for both groups. Rates for these age groups have fallen 69% and 57%, respectively, since 2007, and by 83% and 67% since 1991. The birth rate for females aged 10–14 years was unchanged in 2019 at 0.2 births per 1,000 females.

Among race and Hispanic-origin groups, the birth rates for teenagers aged 15–19 declined 6% for non-Hispanic white, 5% for Hispanic, and 2% for non-Hispanic black teenagers for 2019. Rates for non-Hispanic AIAN, non-Hispanic Asian, and non-Hispanic NHOPI teenagers were essentially unchanged from 2018 to 2019.

Women in their 20s—The birth rate for women aged 20–24 was 66.6 births per 1,000 women in 2019, down 2% from 2018 (68.0), and another record low ([Table 2](#)) (11,13). The rate for women in this age group has declined steadily since 2006. The number of births to women in their early 20s declined 3% from 2018 (15). The rate for women aged 25–29 was 93.7 births per 1,000 women, down 2% from 2018 (95.3). The rate for women in this age group has declined for all but 1 year since 2007 ([Table 2](#)). The number of births to women aged 25–29 was down by 2% from 2018 to 2019 (see [Tables 3](#) and [4](#) for 2018 data) (15).

Women in their 30s—The birth rate for women aged 30–34 was 98.3 births per 1,000 women in 2019, down 1% from 2018 (99.7) and the third straight annual decline in the rate (11,13). The 2019 rate for women aged 30–34 was higher than the rate for women aged 25–29 for the fourth year since reliable national records were available (1940) (11,13). The number of births to women aged 30–34 was essentially unchanged from 2018 to 2019. The birth rate for women aged 35–39 was 52.8 births per 1,000 women in 2019, up slightly from 2018 (52.6), and the second increase in the rate after a brief downtick in 2017 ([Table 2](#)). The number of births to women aged 35–39 rose 1% in 2019 (see [Tables 3](#) and [4](#) for 2018 data) (15).

Women in their 40s—The birth rate for women aged 40–44 was 12.0 births per 1,000 women in 2019, up 2% from

2018 (11.8) ([Table 2](#)); the rate for this group has risen almost continuously since 1985 (11,13). The number of births to women in their early 40s rose 2% from 2018 to 2019. The birth rate for women aged 45–49 (which includes births to women aged 50 and over) was 0.9 births per 1,000 women in 2019, unchanged from 2018. The number of births to women aged 45 and over was also unchanged from 2018 to 2019. Births to women aged 50 and older are also discussed separately below.

Women aged 50 and over—There were 1,073 births to women aged 50 and over in 2019, up from 959 in 2018 ([Table 3](#)) (15). The number of births to women in this age group has generally increased since 1997 (144). The birth rate for women aged 50–54 rose to 1.0 births per 10,000 women in 2019, from 0.9 in 2018. Because of the small number of births to women in this age group, the birth rate for women aged 50–54 is expressed per 10,000 women. For rates shown elsewhere in this report, births to women aged 50 and over are included with births to women aged 45–49 when computing birth rates by age of mother (the denominator for the rate is women aged 45–49).

Live-birth order

The first-birth rate for the United States was 22.0 births per 1,000 females aged 15–44 in 2019, down 2% from 2018 (22.4) (see [Tables 3](#) and [4](#) for the number of births and [Table 5](#) for birth rates). First-birth rates declined for females in their teens (down 5% for females aged 15–19 years), 20s (down 1% each for women aged 20–24 and 25–29), and 30s (down 2% for women aged 30–34 and 1% for women aged 35–39). First-birth rates for females aged 10–14 years, 40–44, and 45–49 were unchanged in 2019 (15).

Mean age of mother

In 2019, the mean age of mothers at first birth was 27.0 years, an increase from 26.9 in 2018, and another record high for the nation ([Tables 11](#), [12](#), and [I–6](#)) (11,13). The mean age at first birth is the arithmetic average of the age of mothers at the time of birth and is computed directly from the frequency of first births by age of mother. The increase in the mean age in 2019 reflects, in part, the decline in the number of first births to females in their teens and 20s (15).

Mean age at first birth increased for nearly all race and Hispanic-origin groups in 2019, rising to 25.1 years for Hispanic, 25.2 for non-Hispanic black, 27.8 for non-Hispanic white, and 30.7 for non-Hispanic Asian women ([Tables 11](#), [12](#), and [I–6](#)) (15). The average age at first birth for non-Hispanic AIAN and non-Hispanic NHOPI women was 23.5 and 24.8 in 2019, essentially unchanged from 2018. Among the specified Hispanic groups, average ages increased to 24.5 years for Mexican, 24.9 for Puerto Rican, 26.0 for Dominican, and 27.9 for Cuban women, and decreased for Central and South American women (26.2) (15). (The decline in mean age at first birth for Central and South American women may be related to changes in reporting of Hispanic-origin births for California; see "Number of births" in this report.)

Total fertility rate

The **total fertility rate** (TFR) for the United States in 2019 was 1,706.0 births per 1,000 women, down 1% from 2018 (1,729.5) (Table 2). This is the fifth year that the TFR has declined following an increase in 2014. From 2007 to 2013, the rate declined steadily. The TFR estimates the number of births that a hypothetical group of 1,000 women would have over their lifetimes, based on age-specific birth rates in a given year. Because it is calculated from age-specific birth rates, TFR is age-adjusted and can be compared for populations across time, population groups, and geographic areas.

Among the race and Hispanic-origin groups, the TFR declined for nearly all groups in 2019, down 2% for non-Hispanic white and non-Hispanic AIAN women and 1% for non-Hispanic black, non-Hispanic Asian, and Hispanic women. The rate for non-Hispanic NHOPI women rose 3% from 2018 to 2019.

The TFR for the nation in 2019 remained below “replacement,” the level at which a given generation can exactly replace itself (generally considered to be 2,100 births per 1,000 women). The U.S. TFR has generally been below replacement since 1971 (11,13). The TFR was below replacement for all race and Hispanic-origin groups in 2019, except non-Hispanic NHOPI women (2,178.0) (Table 2).

Births and birth rates by state

The GFR, the number of births per 1,000 females aged 15–44, declined from 2018 to 2019 by 1% to 3% in 27 states, and by 4% to 5% in 3 states (Maine, Montana, and South Dakota); rose in 1 state (Alabama); and was essentially unchanged in the remaining 19 states and D.C. Rates among the states ranged from 46.8 births per 1,000 females aged 15–44 in Vermont to 70.6 in North and South Dakota. (See Tables 6 and 7 for the number of births and Table 8 for birth rates). Among the U.S. territories, the GFR declined in Puerto Rico, rose in Northern Marianas, and was essentially unchanged in Guam. For the number of births by state in 2019, see Tables 6 and 7.

Birth rates for teenagers by state

In 2019, the birth rate for teenagers aged 15–19 declined in 21 states (Arizona, California, Florida, Georgia, Illinois, Indiana, Iowa, Kentucky, Maine, Michigan, Missouri, Nebraska, Nevada, New Hampshire, Oregon, Pennsylvania, Rhode Island, Tennessee, Texas, Utah, and Virginia), with declines ranging from 3% for Florida to 18% for Maine and New Hampshire. Rates were essentially unchanged in the remaining 29 states and D.C. Rates among the states ranged from 6.6 births per 1,000 in New Hampshire to 30.0 in Arkansas (Table 8). The wide range

Figure 3. Birth rates, by selected age of mother: United States, 1990–2019

in state-specific teen rates is consistent with patterns observed in previous analyses (14,16). Teen birth rates were essentially unchanged for Puerto Rico, Guam, and Northern Marianas. Rates among the territories ranged from 19.1 births per 1,000 teenagers in Puerto Rico to 33.3 in Guam (Table 8).

Births to unmarried women

The birth rate for unmarried women was 39.9 births per 1,000 unmarried women aged 15–44 in 2019, down less than 1% from 2018 (40.1) (Table 10). The 2019 nonmarital birth rate was 23% lower than the peak of 51.8 in 2007 and 2008 (11). (See Technical Notes for description of the adjustments made to calculations of rates by marital status beginning with 2017).

The birth rate for married women also declined in 2019, to 84.0 per 1,000 married women aged 15–44, from 85.6 in 2018. The marital birth rate declined 4% over the period 2005–2010 but rose 6% from 2010 through 2016 before declining 6% through 2019 (11).

The percentage of all births to unmarried women was 40.0% in 2019, up from 2018 (39.6%), which was the lowest level since 2007 (11). The percentage of all births to unmarried women peaked in 2009 at 41.0% (11).

In 2019, the percentage of nonmarital births increased from 2018 for three race and Hispanic-origin groups: non-Hispanic black (70.0% in 2019), Hispanic (52.1%), and non-Hispanic AIAN women (69.0%) (Table 9). The percentage was unchanged for three groups: non-Hispanic white (28.2%), non-Hispanic Asian (11.7%), and non-Hispanic NHOPI women (50.4%). The number of nonmarital births decreased by 3% from 2018 (1,503,361) to 2019 (1,498,113) (15). Nonmarital birth rates declined from 2018 to 2019 for women in age groups under 30, with the rate for teenagers aged 15–19 dropping 4% (to 15.4 per 1,000 in 2019), and the rate for females aged 15–17 at another all-time low (6.6). Conversely, the nonmarital birth rate reached historic peaks for women aged 30–34, to 60.6, and for women aged 40–44, to 11.1.

Compositional differences by race and Hispanic origin and maternal age among states are major contributing factors to the geographic variation in the percentage of births to unmarried mothers (Table 1–7). In 2019, the percentages of unmarried births ranged from about one in five births in Utah (19.2%) to more than one-half of births in Louisiana (54.0%), Mississippi (54.9%), and New Mexico (51.5%).

Tobacco Use Before and During Pregnancy (Tables 13–15)

Of the women who gave birth in 2019, 6.0% reported smoking tobacco at some point while pregnant, an 8% decline from 2018 (6.5%) (Table 15) (15). Tobacco use was most common earlier in pregnancy: 5.8% of women smoked in their first trimester, 5.0% in their second, and 4.7% in their third. Of the 7.7% of women who reported smoking in the 3 months before becoming pregnant, 24.0% quit smoking before pregnancy (Table 15).

By race and Hispanic origin, 8.8% of non-Hispanic white women reported smoking at some point during pregnancy, down 7% from 2018; 4.8% of non-Hispanic black women reported smoking at some point during pregnancy, down 8%; 1.5% of Hispanic women reported smoking during pregnancy, down 12% from 2018. See Tables 13 and 14 for smoking levels among other race and Hispanic-origin groups. Rates of quitting smoking before pregnancy also varied by race and Hispanic origin: 22.2% of non-Hispanic white, 25.2% of non-Hispanic black, and 38.3% of Hispanic women who smoked during the 3 months prior to pregnancy, did not smoke while pregnant.

By maternal age, smoking rates during pregnancy were highest among women aged 20–24 (8.1%) and for women under age 20 (6.7%) and 25–29 (6.9%). Tobacco use during pregnancy was less common among older women, with 3.5% of women aged 40–54, and 4.2% of women aged 35–39 reporting smoking during pregnancy (Table 15).

Medical and Health Services Utilization and Source of Payment for the Delivery (Tables 13–19)

Use and timing of prenatal care

Among women giving birth in 2019, 77.6% began prenatal care in the first trimester of pregnancy, up from 77.5% in 2018. Late (beginning in the third trimester) or no prenatal care increased in 2019 to 6.4%, from 6.2% in 2018 (Table 16) (15).

Among the largest race and Hispanic-origin groups, prenatal care beginning in the first trimester increased for non-Hispanic white (from 82.5% in 2018 to 82.8% in 2019) and non-Hispanic black (67.1% to 67.6%) women, and declined for Hispanic women (72.7% to 72.1%) in 2019 (Table 16) (15). Late or no prenatal care declined for non-Hispanic black women (9.9% to 9.6%), was unchanged for non-Hispanic white women (4.5%), and increased for Hispanic women (7.7% to 8.2%). The increase in late or no care among Hispanic women occurred for all maternal age groups under age 40 (Figure 4).

Timing of prenatal care continued to vary by race and Hispanic origin in 2019. First trimester care ranged from 50.0% for non-Hispanic NHOPI to 82.8% for non-Hispanic white women; late or no prenatal care ranged from 4.5% for non-Hispanic white women to 20.5% for non-Hispanic NHOPI women (Table 13).

By age of mother, women aged 35–39 were less likely to receive first trimester prenatal care in 2019 (81.6%) than in 2018 (81.7%). Rates for all other age groups were unchanged in 2019 (Table 16) (15).

Method of delivery

Cesarean delivery

In 2019, the cesarean delivery rate decreased to 31.7%, from 31.9% in 2018 (Figure 1, Table 17), the lowest rate since 2006 (31.1%) (11). The cesarean delivery rate peaked in 2009 at 32.9% after increasing every year since 1996 (20.7%) (11,15).

Figure 4. Late or no prenatal care, by age of mother among Hispanic women: United States, 2018–2019

The cesarean delivery rate decreased for each of the three largest race and Hispanic-origin groups, from 30.8% in 2018 to 30.7% in 2019 for non-Hispanic white women, 36.1% to 35.9% for non-Hispanic black women, and 31.6% to 31.3% for Hispanic women (Table 17). Tables 13 and 14 show cesarean delivery rates for more detailed race and Hispanic-origin groups.

By maternal age, cesarean delivery decreased for all age groups except 35–39, for which it was unchanged (40.0%) (Table 18). Cesarean delivery continued to be higher among older women compared with younger mothers; women aged 40 and over (47.4%) were more than twice as likely to deliver by cesarean than women under age 20 (19.3%).

Low-risk cesarean delivery—The low-risk cesarean delivery rate also decreased in 2018, from 25.9% to 25.6% for 2018–2019. The low-risk cesarean delivery rate is cesarean delivery among nulliparous (first birth), term (37 or more completed weeks based on the obstetric estimate), singleton (one fetus), and cephalic (head-first) births. See Tables 13, 14, 17, and 18 for details by age and race and Hispanic origin of the mother.

Primary cesarean delivery—In 2019, the primary cesarean delivery rate, which measures cesarean deliveries among women who have not had a previous cesarean delivery, was 21.6%, down from 21.7% in 2018. (Tables 17 and 18).

Vaginal birth after previous cesarean delivery (VBAC)—

The VBAC rate measures vaginal births among women with a previous cesarean delivery. In 2019, 13.8% of women with a previous cesarean delivered vaginally, up 4% from 13.3% in 2018; the rate has increased every year since 2016 when national data became available. See Tables 17 and 18 for details. Changes in VBAC overall and by race and Hispanic origin through 2018 are presented in a recent report (17).

Source of payment for the delivery

The principal source of payment for the delivery of most births in 2019 continued to be either private insurance or Medicaid; however, the percentage of births covered by private insurance increased from 2018 (from 49.6% to 50.2%), and the percentage of births covered by Medicaid declined (from 42.3% to 42.1%). The category “self-pay,” generally considered to indicate uninsured deliveries, accounted for 4.2% of 2019 births, unchanged from 2018. The remainder of births were covered by other insurance (3.5%; down from 3.9% in 2018); other insurance includes Indian Health Service, CHAMPUS or TRICARE, other government (federal, state, or local), or charity (Table 19) (15).

The percentage of births covered by private insurance increased from 2018 to 2019 for each of the three largest race and Hispanic-origin groups (Table 19) (15). In 2019, the percentage of mothers using private insurance ranged from 29.3% for non-Hispanic black women to 63.8% for non-Hispanic white women; the percentage for Hispanic women was 30.5%. Changes in Medicaid coverage for the delivery were presented in a previous report (2). In 2019, Medicaid coverage ranged from 29.4% for non-Hispanic white women to 59.0% for Hispanic women and 65.1% for non-Hispanic black women. See Tables 13 and 14 for information on additional race and Hispanic-origin groups.

By age of mother, Medicaid as the source of payment declined for women aged 20–24 (63.1% to 62.9%) and 25–29 (44.8% to 44.7%), increased for women under age 20 (77.3% to 78.2%) and aged 30–34 (29.4% to 29.6%), and remained unchanged for women aged 35 and over between 2018 and 2019 (Table 19) (15). The percentages of births with Medicaid as the source of payment ranged from 27.4% for women aged 35–39 to 78.2% for women under age 20. Private insurance as the source of payment for the delivery increased in 2019 for women in age groups 20 and over. Percentages with private insurance ranged from 15.0% for women under age 20 to 65.1 for women aged 35–39 (Table 19).

Infant Health Characteristics (Tables 20–25)

Period of gestation

The U.S. preterm birth rate rose to 10.23% in 2019, up 2% from 2018 (10.02%), and the fifth straight year of increases in this rate (9.57% in 2014). The preterm birth rate (percentage of all births delivered at less than 37 completed weeks of gestation) had declined steadily from 2007 (10.44%) (11) to 2014 (Table 20). (National data based on the obstetric estimate of gestation are available only from 2007 (18); see Technical Notes.)

Most of the increase in the total preterm birth rate for 2018–2019 was among infants born late preterm (34–36 weeks), up from 7.28% to 7.46%. The early preterm birth rate (less than 34 weeks) increased from 2.75% in 2018 to 2.77% in 2019. The early preterm rate was essentially unchanged from 2014 to 2018, but is down from 2.93% in 2007 (11,18).

Changes in the distribution of births delivered at term and later (37 and higher weeks) were also observed from 2018 to 2019. The percentage of infants born early term (37–38 weeks) rose by 3% in 2019, from 26.53% to 27.31%, and the full-term (39–40 weeks) birth rate declined, from 57.24% to 57.02%. From 2007 to 2014, in contrast, the early-term birth rate had generally been on the decline and the full-term rate had been on the rise (11). Declines were also seen from 2018 to 2019 in late (41 weeks) and post-term (42 weeks and higher) births (Table 20). Similar trends in births delivered at less than full term were seen for the three largest race and Hispanic-origin groups for 2018–2019.

Preterm birth rates rose by 2% among births to non-

Hispanic white (from 9.09% to 9.26%), non-Hispanic black (14.13% to 14.39%), and Hispanic mothers (9.73% to 9.97%) between 2018 and 2019 (Table 20). For 2019, preterm birth rates for the race and Hispanic-origin groups ranged from a high of 14.39% among births to non-Hispanic black mothers, to a low of 8.72% among non-Hispanic Asian mothers (Table 13). Preterm levels for the Hispanic subgroups ranged from 9.44% (Central and South American) to 11.51% (Puerto Rican) (Table 14).

It can also be important to analyze births in singleton deliveries separately from all births because of the shorter average gestations of multiple births and their accordant potential influence on preterm birth rates (also see “Multiple births” in this report). The 2019 preterm birth rate for singleton births only was 8.47%, a 3% increase over the 2018 level of 8.24%, and an 8% rise from 2015 (7.82%). From 2007 through 2014, the singleton preterm rate had declined from 8.59% to 7.74% (see Table for 2019 data) (15).

Increases in preterm birth rates were observed in 15 states between 2018 and 2019: California, Colorado, Delaware, Florida, Kansas, Minnesota, Nevada, New York, North Carolina, Ohio, Oregon, Pennsylvania, Texas, Virginia, and West Virginia. The rate declined in one state (Iowa) for this period. See Table I–19 for 2019 data.

Birthweight

The percentage of infants born low birthweight (LBW) was 8.31% for 2019, a nonsignificant increase from 2018 (8.28%). The LBW rate (the percentage of infants born at less than 2,500 grams or 5 pounds, 8 ounces) has risen 4% since the most recent low in 2014 (8.00%) and is the highest rate reported since the 2006 peak (8.26%) (Tables 22 and 23) (11). From 1990 to 2006, LBW levels rose nearly 20%, but then declined from 2007 to 2012 (7.99%) (11).

The very low birthweight (VLBW, less than 1,500 grams) rate was unchanged at 1.38% in 2019. The VLBW rate had been essentially stable at 1.40%–1.41% for 2013–2017, and is down from a high of 1.49% for 2005–2007 (11). The percentage of moderately low birthweight infants (1,500–2,499 grams) was 6.93% in 2019, a nonstatistically significant increase from 2018 (6.90%); moderately low birthweight levels for 2016–2019 have matched or surpassed the peak reported for 2006 (6.77%) (Table 22) (11).

Between 2018 and 2019, LBW rates were essentially unchanged among births to non-Hispanic white women (6.89% for 2019), non-Hispanic black women (14.15%), and Hispanic women (7.55%). Since 2016, LBW rates have declined 1% for non-Hispanic white women (from 6.97%), but are up 3% for non-Hispanic black (13.68%) and Hispanic (7.32%) women (Table 22). See Tables 13, 14, I–21, and I–22 for 2019 VLBW and LBW rates by state and by race and Hispanic origin.

The LBW rate among singleton births only rose from 6.60% to 6.67% from 2018 to 2019 (15); the increase was among infants born moderately low birthweight; see the Table for 2019 data and “Multiple births.” It can be informative to examine births in singleton deliveries separately because multiple births tend to be born smaller than singletons, and changes in multiple-birth incidence can influence overall LBW levels.

Table. Gestational age and birthweight characteristics by plurality: United States, 2019

Plurality	Number of births	Percent			
		Early preterm ¹	Preterm ²	Very low birthweight ³	Low birthweight ⁴
All births	3,747,540	2.77	10.23	1.38	8.31
Singleton	3,623,963	2.14	8.47	1.09	6.67
Twin	120,291	19.96	60.87	9.40	55.48
Triplet	3,136	62.90	98.50	34.10	95.29
Quadruplet	114	85.09	95.61	61.40	95.61
Quintuplet and higher-order multiples	36	100.00	100.00	100.00	100.00

¹Less than 34 completed weeks of gestation.²Less than 37 completed weeks of gestation.³Less than 1,500 grams.⁴Less than 2,500 grams.

SOURCE: National Center for Health Statistics, National Vital Statistics System, Natality.

Figure 5. Number and rate of twin births: United States, 1980–2019

SOURCE: National Center for Health Statistics, National Vital Statistics System, Natality.

Multiple births

The 2019 twin birth rate was 32.1 twins per 1,000 births, a 2% decline from the 2018 rate of 32.6, and down 5% from the 2014 high of 33.9. The twinning rate (births in twin deliveries per 1,000 total births) rose 76% from 1980 to 2009 (from 18.9 to 33.2 per 1,000), was generally stable from 2009 through 2012, and then rose for 2013 and 2014 (Figure 5, Tables 24 and 25) (11).

The triplet and higher-order multiple birth rate (triplet/+) was 87.7 per 100,000 births for 2019, a 6% decline from 2017 (93.0) and down 55% from the 1998 peak (193.5) (11). The triplet/+ birth rate (number of triplets, quadruplets, and quintuplets and other higher-order multiples per 100,000 births), rose more than 400% from 1980 to 1998 (Tables 24 and 25) (11).

There were 120,291 infants born in twin deliveries in 2019, a decline of 3% from the number in 2018 (Table 25). The number

of triplet/+ born in 2019, 3,286, was the lowest number reported since 1990 and less than one-half of the highest number reported (7,663 triplet/+ in 2003) (11). In 2019, triplet/+ births included 3,136 triplets, 114 quadruplets, and 36 quintuplet and higher-order multiple births. See the Table for the number of births and percentages of preterm and LBW births by specified plurality.

Twin birth rates declined among non-Hispanic white women by 3% from 2018 to 2019 (from 34.4 to 33.4 per 1,000), but were largely stable among non-Hispanic black (40.8 to 40.9) and Hispanic (24.4 to 24.6) women. Triplet/+ birth rates declined 5% among non-Hispanic white women (102.0 to 97.3) and 10% among non-Hispanic black women (119.2 to 107.5), but were not significantly changed for Hispanic women (64.7 to 66.6) (Table 24; see also Tables 13 and 14 for 2019 twin and triplet/+ rates for additional race and Hispanic-origin groups). For state-specific twin and triplet/+ rates, see Table I-23.

¹Includes births to race and origin groups not shown separately, such as Hispanic single-race white, Hispanic single-race black, and non-Hispanic multiple-race women, and births with origin not stated.

²Race and Hispanic origin are reported separately on birth certificates; persons of Hispanic origin may be of any race. In this table, non-Hispanic women are classified by race. Race categories are consistent with the 1997 Office of Management and Budget standards; see Technical Notes in this report. Single race is defined as only one race reported on the birth certificate.

³Includes all persons of Hispanic origin of any race; see Technical Notes.

Table 2. Birth rates, by age of mother: United States, 2010–2019, and by age and race and Hispanic origin of mother: United States, 2016–2019

[Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Birth rates are births per 1,000 women in specified group. Populations based on counts enumerated as of April 1 for census years and estimated as of July 1 for all other years]

		Age of mother (years)

¹Includes births to race and origin groups not shown separately, such as Hispanic single-race white, Hispanic single-race black, and non-Hispanic multiple-race women, and births with origin not stated.²Race and Hispanic origin are reported separately on birth certificates; persons of Hispanic origin may be of any race. In this table, non-Hispanic women are classified by race. Race categories are consistent with the 1997 Office of Management and Budget standards; see Technical Notes in this report. Single race is defined as only one race reported on the birth certificate.³Includes all persons of Hispanic origin of any race; see Technical Notes.

0.0 Quantity more than zero but less than 0.05.

¹Birth rates computed by relating births to women aged 45 and over to women aged 45–49; see Technical Notes in this report.

²Includes births to race and origin groups not shown separately, such as Hispanic single-race white, Hispanic single-race black, and non-Hispanic multiple-race women, and births with origin not stated.

³Race and Hispanic origin are reported separately on birth certificates; persons of Hispanic origin may be of any race. In this table, non-Hispanic women are classified by race. Race categories are consistent with the 1997 Office of Management and Budget standards; see Technical Notes. Single race is defined as only one race reported on the birth certificate.

⁴Includes all persons of Hispanic origin of any race; see Technical Notes.

--- Comparable data were not available for the 50 states and the District of Columbia for 2010–2015 because not all reporting areas had adopted the 2003 U.S. Certificate of Live Birth.

¹Includes unknown type of vaginal delivery; see Technical Notes in this report.

²Includes unknown type of cesarean delivery; see Technical Notes.

³Low-risk cesarean is defined as singleton, term (37 or more completed weeks of gestation based on the obstetric estimate), cephalic, cesarean deliveries to women having a first birth.

⁴Percentage of all live births delivered by cesarean.

⁵Primary cesarean rate is the number of births to women having a cesarean delivery per 100 births to women without a previous cesarean.

⁶Low-risk cesarean rate is the number of singleton, term (37 or more completed weeks of gestation based on the obstetric estimate), cephalic, cesarean deliveries to women having a first birth per 100 women delivering singleton, term, cephalic, first births.

⁷Vaginal birth after cesarean delivery rate is the number of births to women having a vaginal delivery per 100 births to women with a previous cesarean delivery.

⁸Includes births to race and origin groups not shown separately, such as Hispanic single-race white, Hispanic single-race black, and non-Hispanic multiple-race women, and births with origin not stated.

⁹Race and Hispanic origin are reported separately on birth certificates; persons of Hispanic origin may be of any race. In this table, non-Hispanic women are classified by race. Race categories are consistent with the 1997 Office of Management and Budget standards; see Technical Notes. Single race is defined as only one race reported on the birth certificate.

¹⁰Includes all persons of Hispanic origin of any race; see Technical Notes.

See footnotes at end of table.

Table 21. Births, by gestational age (weeks) and by age and race and Hispanic origin of mother: United States, 2019—Con.

* Estimate does not meet National Center for Health Statistics standards of reliability.

– Quantity zero.

¹Expressed in completed weeks based on the obstetric estimate of gestation; see Technical Notes in this report.

²Includes births to race and origin groups not shown separately, such as Hispanic single-race white, Hispanic single-race black, and non-Hispanic multiple-race women, and births with origin not stated.

³Race and Hispanic origin are reported separately on birth certificates; persons of Hispanic origin may be of any race. In this table, non-Hispanic women are classified by race. Race categories are consistent with the 1997 Office of Management and Budget standards; see Technical Notes. Single race is defined as only one race reported on the birth certificate.

⁴Includes all persons of Hispanic origin of any race; see Technical Notes.

¹Equivalents of gram weights in pounds and ounces are shown in the User Guide; see reference 8 in this report.

²Includes births to race and origin groups not shown separately, such as Hispanic single-race white, Hispanic single-race black, and non-Hispanic multiple-race women, and births with origin not stated.

³Race and Hispanic origin are reported separately on birth certificates; persons of Hispanic origin may be of any race. In this table, non-Hispanic women are classified by race. Race categories are consistent with the 1997 Office of Management and Budget standards; see Technical Notes in this report. Single race is defined as only one race reported on the birth certificate.

⁴Includes all persons of Hispanic origin of any race; see Technical Notes.

Technical Notes

Data source

Data shown in this report for 2019 are based on 100% of the birth certificates filed in all states and the District of Columbia (D.C.). The data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). Information on the percentage of records with missing information for maternal and infant characteristics included in this report is shown by state in the "User Guide to the 2019 Natality Public Use File" (8); methodological and measurement information for these characteristics is also available in the 2019 User Guide.

2003 revision of U.S. Standard Certificate of Live Birth

Data for 2016–2019 presented in this report are based on the 2003 revision of the U.S. Standard Certificate of Live Birth; data for 2010–2015 are based on both the 1989 and the 2003 birth certificate revisions. The 2003 revision is described in detail elsewhere (19).

Age of mother

Age of mother is computed in most cases from the mother's and infant's dates of birth as reported on the birth certificate. Since 2007, age of mother has been imputed for ages 8 and under and 65 and over. Mothers aged 9 are recoded as aged 10. A review and verification of unedited data for several years including 2007 showed that the vast majority of births reported as occurring to women aged 50 and over were to women aged 50–54. In this report, the final age group shown in the tables (45–49, 45–54, or 50–54) includes births to mothers up to age 64. For historical information on mother's age, see the User Guide (8).

Marital status

Due to state statutory restrictions, beginning in 2017, California no longer provides record-level data on the marital status of the mother for births occurring in, or to residents of, the state. In lieu of record-level data, however, California provides counts of births by marital status category (married, unmarried, and unknown) by age and race and Hispanic origin of the mother according to age and race and Hispanic-origin categories shown in this report to NCHS. For consistency with procedures for handling missing information for other jurisdictions, California's counts of birth by marital status were redistributed (proportionately) to the same maternal age, race, and marital status subgroups in the data set to obtain the national estimates by marital status. This approach is consistent with hot-deck procedures used for non-California records to impute for missing age, race, and marital status based on records for which these characteristics are known.

Hispanic origin and race

Hispanic origin

Hispanic origin and race are reported separately on the birth certificate. Data are shown in most cases for five specified Hispanic groups: Mexican, Puerto Rican, Cuban, Central and South American, and Other and unknown Hispanic. Starting in 2018, data are presented for an additional Hispanic group, Dominican, which was previously included in the category Other and unknown Hispanic. In tabulations of birth data by race and Hispanic origin, data for persons of Hispanic origin are not further classified by race because the vast majority of births to Hispanic women are reported as white.

Items asking for the Hispanic origin of the mother (and the father) have been included on the birth certificates of all states, D.C., Virgin Islands, and Guam since 1993, and on the birth certificates of Puerto Rico starting in 2005 and Commonwealth of the Northern Marianas starting in 2010 (8,11). American Samoa does not collect information on Hispanic origin.

The Hispanic-origin question on the 2003 revision of the birth certificate asks respondents to select only one response. Occasionally, however, more than one Hispanic-origin response is given, that is, a specified Hispanic group (Mexican, Puerto Rican, Cuban, Dominican, or Central and South American) in combination with one or more other specified Hispanic group. From 2003 through 2012, respondents who selected more than one Hispanic origin on the birth certificate were classified as "Other Hispanic." Beginning with the 2013 data year, respondents who select more than one Hispanic origin are randomly assigned to a single Hispanic origin. This change was implemented to be consistent with the coding methods of the American Community Survey (20), on which the rates for the specified Hispanic groups as of 2010 are based (see "Population estimates for specific Hispanic groups").

Race

This report presents data on race and Hispanic origin based on the 1997 Office of Management and Budget (OMB) standards (10). The 2003 revision of the U.S. Standard Certificate of Live Birth allows the reporting of the five race categories either alone (i.e., single race) or in combination (i.e., more than one race or multiple races) for each parent (9), in accordance with the revised standards issued by the Office of Management and Budget (OMB) in 1997 (10). The five categories for race specified in the revised standards are: American Indian or Alaska Native (AIAN), Asian, Black or African American, Native Hawaiian or Other Pacific Islander (NHOPI), and White; see 2019 User Guide (8).

Beginning in 2016, all states and D.C., in addition to Puerto Rico, U.S. Virgin Islands, Guam, and Northern Marianas, were reporting race according to the 1997 revised OMB standards, with 2.7% of mothers in the United States reporting more than one race (8) in 2019. Data from American Samoa still follow the 1977 OMB standards (21). Prior to 2016, the multiple-race reporting states varied widely, increasing from 6 states in 2003, to the 50 states and D.C. and all territories except American Samoa in 2016.

Gestational age

Beginning with the 2014 data year, NCHS transitioned to a new standard for estimating the gestational age of the newborn. The new measure—the obstetric estimate of gestation at delivery (OE)—replaces the measure based on the date of the last normal menses (LMP) (18). National data based on the OE are available only from data year 2007 forward. Gestational age estimates differ somewhat between the OE- and LMP-based measures. Accordingly, gestational age data in this report are based on the OE. Information and discussion of the reasons for the change, and a detailed comparison of the two measures, are presented elsewhere (18).

Computations of percentages, percent distributions, and means

For information and discussion on computations of percentages, percent distributions, and means, see the User Guide (8).

Population denominators

The birth and fertility rates for 2019 shown in [Tables 1, 2, 5, 8, 10, 11](#), and [I-2](#) are based on populations estimated from the 2010 census as of July 1, 2019. These populations are shown in the User Guide (8). The population estimates have been provided by the U.S. Census Bureau (22), and are based on the 2010 census counts by age, sex, and race. The race categories are consistent with the revised 1997 OMB standards (10).

The birth and fertility rates by state shown in [Table 8](#) are based on state-level population counts, which are based on the 2010 census provided by the U.S. Census Bureau (22). Birth and fertility rates for the territories except Puerto Rico shown in [Table 8](#) are based on population estimates provided by the U.S. Census Bureau's International Data Base (23). Rates for Puerto Rico are based on population estimates from the 2010 census as of July 1, 2019, and are provided by the U.S. Census Bureau (24).

Rates by state and territory shown in this report may differ from rates computed based on other population estimates; rates for smaller population subgroups, such as those for teen mothers, may be particularly affected by differences in population estimates. Birth and fertility rates by month shown in [Table I-2](#) are based on monthly population estimates for 2019, which are also based on 2010 Census estimates. For 2019, rates for unmarried women shown in [Tables 10](#) and [11](#) are based on distributions of the population by marital status averaged over a 2-year period for 2018–2019. These distributions were reported by the U.S. Census Bureau in the March Current Population Survey for each year (25,26), and have been adjusted to July 1, 2019 (2010 census), population levels (22) by NCHS' Division of Vital Statistics (27).

The population distributions by marital status are based on a 2-year average (of the current and prior year) from 2014 through 2019 (11). For earlier years, rates for unmarried women are based on distributions of the population by marital status averaged over a 3-year period (27).

Population estimates for specific Hispanic groups

The 2019 population estimates for the specific Hispanic population groups were not available as of the preparation of this report (28). Accordingly, birth and fertility rates for these groups for 2019 are not shown in this report. Once available, birth and fertility rates for the specific Hispanic population groups will be added to [Table 12](#). The 2019 special population estimates for Hispanic groups will be shown in the User Guide, once available (8).

Computation of rates and percentages

An asterisk (*) in the tables indicates that a rate or percentage does not meet NCHS standards of reliability or precision. For population-based rates, an asterisk is shown in place of a rate based on fewer than 20 births in the numerator. For percentages, new standards have been adopted by NCHS and implemented for natality data beginning with the 2017 data year. The new standard is based on denominator size and on the absolute or relative widths of the confidence interval of the proportion or percentage calculated using the Clopper–Pearson method. This compares with the previous standard for which, similar to the standard for population-based rates, an asterisk was used for percentages based on fewer than 20 births in the numerator. For detailed information on the 2017 standard, see “National Center for Health Statistics Data Presentation Standards for Proportions” and the User Guide (8,29).

Random variation and significance testing for natality data

For information and discussion on random variation and significance testing for natality data, see the 2010 User Guide (30).

For information and discussion on random variation and significance testing for birth and fertility rates for Mexican, Puerto Rican, Cuban, Dominican, Central and South American, and Other Hispanic populations based on ACS population estimates, see the User Guide (8).

Definitions of medical terms

For definitions and discussion of medical and health items presented in this report, see “Guide to Completing the Facility Worksheets for the Certificate of Live Birth and Report of Fetal Death” (31).

Acknowledgments

This report was prepared in the Division of Vital Statistics (DVS) under the general direction of DVS Director Steven Schwartz; Isabelle Horon, Chief, Reproductive Statistics Branch (RSB); and Joyce Martin, Team Leader, RSB Birth Team. Rajesh Virkar, Chief of the Systems, Programming, and Statistical Resources Branch (SPSRB), and Steve J. Steimel, Annie S. Liu, and Jasmine N. Mickens provided computer programming support and statistical tables. Steve J. Steimel and Annie S. Liu of SPSRB prepared the natality file. The Data Acquisition and Evaluation Branch staff of DVS evaluated the quality of and acceptance procedures for the state data files on which this report is based.

This report was edited and produced by NCHS Office of Information Services, Information Design and Publishing Staff: Nora Castro edited the report; typesetting was done by Kyung Park; and graphics were produced by Dorothy Day.
